

HOW TO USE:

- 1) Fill the body of the nectar collector with water.
- 2) Freeze the glycerin glass chamber in the freezer for 10-15 minutes.
- 3) Use a blow torch and heat the nectar collector's tip. Heat it for about 40 to 50 seconds. Heating times vary depending on the strength of your torch, quality of your tip and your desired heating temperature.
- 4) Once heated, allow the tip to cool for about 15 to 30 seconds. Once it's at your desired temperature, place your mouth around the glass straw mouth piece and slowly inhale as you lightly apply the tip to the concentrates in the dish.
- 5) Inhale as the vapor forms and remove the dab straw from the dish when done.
